behat

```php
<?php
require_once 'PHPUnit/Extensions/SeleniumTestCase.php';

class WebTest extends PHPUnit_Extensions_SeleniumTestCase
{
    protected function setUp()
    {
        $this->setBrowser('*firefox');
        $this->setBrowserUrl('http://www.example.com/');
    }

    public function testTitle()
    {
        $this->open('http://www.example.com/');
        $this->assertTitle('Example WWW Page');
    }
}
?>
```

Scenario: Page has expected page title
    When I am on the homepage
    Then the page title should equal "**Example WWW Page**"

How can I motivate developers to write (more) test?

How can I make my customers to write tests?

How can I integrate Behat in my TYPO3 applications?

How can I test Double-Opt-Ins and „Forgot Password" Features?

At the end of the session

You will know…

- … how to use the Gherkin Language

- … how to set up Behat in your TYPO3 projects

- … how to extend Behat

- … how to test emails

- … how to write database tests

See you!
